

Dear Sirs,

Proposed Green Paper as presented by the Commission is premature:

- formulating long-term objectives should be done after the international agreements,
- formulating long-term objectives must be preceded by a thorough analysis of the costs broken down by countries,
- in Green Paper, there is no reference to the issue of energy security,
- the Commission did not provide analysis of the lost jobs and lost of competitiveness of the European economy.

The document focuses on further reducing emissions and increasing the use of renewable energy in the EU and this philosophy leads to increase electricity prices and reflects in a loss of competitiveness of the energy industry. Implementation of the Green Paper leads to an increase in electricity prices, which will translate to a reduction in the competitiveness of the economies of the European Union, particularly those in which the important role played by energy-intensive industry, the escaping abroad (seen moving production to the U.S.) and additional load households. It minimizes the role previously used technology which, from the point of view of energy independence and ensure energy security, is a negative solution.

**I strongly disagree with the proposal of the Green Paper.**

Best regards

Jerzy Janikowski
