Welcome to the "Grid Infrastructure Communication Toolkit" – a website that features essential elements for successful, inclusive project communication and a constructive multi-stakeholder dialogue at the local level of any power grid development project in Europe.

All across our continent, immense efforts are undertaken to develop and upgrade our power transmission networks, which enable the reliable, sustainable and affordable supply of electricity to every European citizen.

Because of their strategic importance, as well as their significant impact on local communities and environments, public acceptance for power grid development projects is indispensable.

This website seeks to facilitate and inform the stakeholder dialogue necessary to implement European grid development projects with the highest possible acceptance.
