Re: DG ENER's Public Consultation on the preliminary report on cost-benefit assessment of Gas Quality Harmonisation in the EU  
Statement of the Association Professionnelle Chaleur Decentralisee (<http://www.cer-chauffage.fr>) dated September 16<sup>th</sup>, 2011

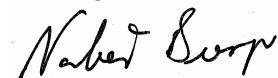

Dear Sirs,  
we refer to the above mentioned statement of CER and would like to inform you that also the European manufacturers of warm air heaters share the concerns expressed by the CER president, Mr. E. Rerolle, regarding to that matter of major importance for public safety.

1. Euro-Air supports the cost benefit analysis and denies the reliability of the technical analysis on our products.
2. Euro-Air suggests a limited gas quality variation that will allow safe operations and preserve effective efficiency for our appliances.

The test results of the "figawa working group GasQual" on warm air heaters, radiant luminous heaters and radiant tube heaters being representative for the predominant population of heating appliances of these technologies in the European market have proven that free variation of gas quality in the supposed range is unacceptable for a satisfying performance of installed decentralized heaters. (The experimental data have been made available for CEN / BT / WG 197.)

Please don't hesitate to contact Euro-Air again for more detailed information!

Best regards

Dr. N. Burger  
EURO-AIR
