E-CONTROL

## 2.5 Risk Preparedness

Florence Forum, March 2016

Christine Materazzi-Wagner

# There should be benefit in new regulation

E-CONTROL

The objectives ...

- to jointly prevent crisis situations and in case of occurrence restore quickly
- to use the more integrated system also during crisis situations (not just on a normal market day) to gain synergies

... lead to ...

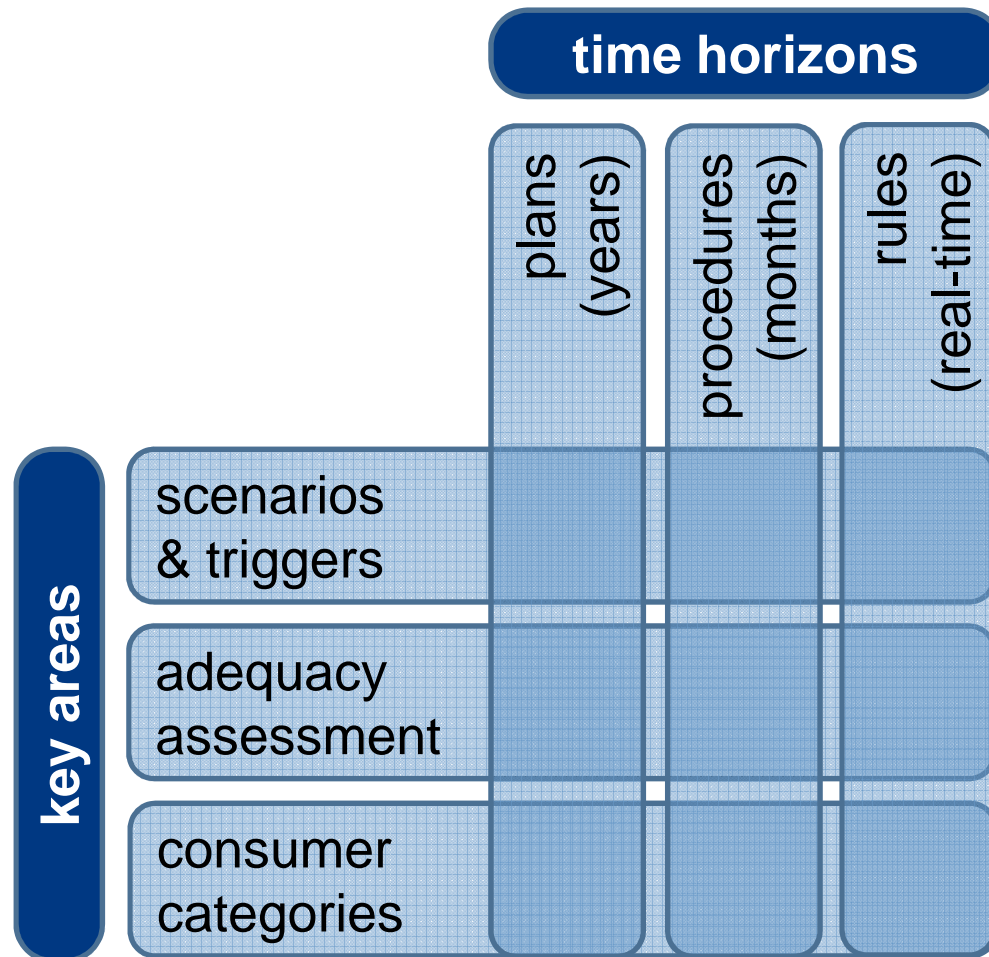

- need for (mandatory) regional coordination and alignment
- need for information exchange and proper communication
- questions of solidarity

**The SoS Regulation significantly improved the situation in gas.**

**Hence,**

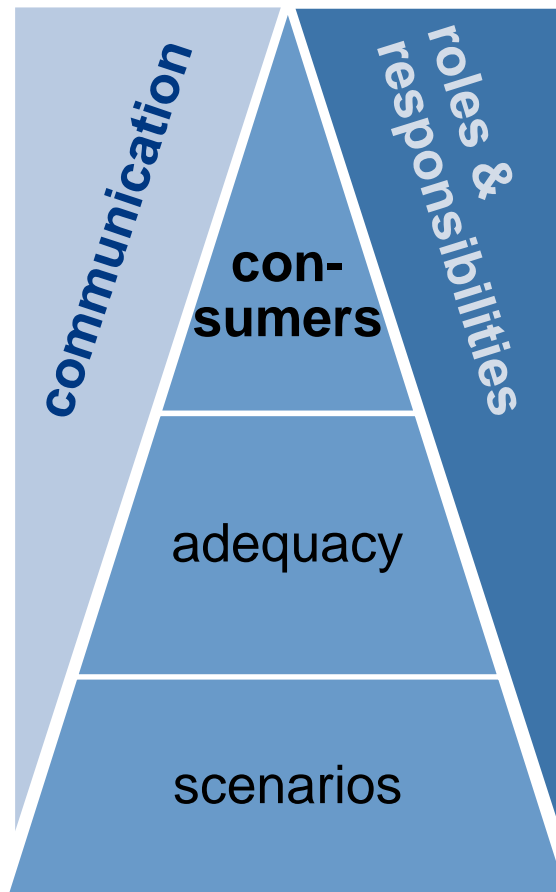

- **take status quo,**
- **select best practice,**
- **add regional approach and create the electricity SoS Regulation.**

# A matrix approach seems necessary

- Agreements on preparation measures are needed
- Content and time to be considered
- Important: clear interfaces to the 'emergency and restoration' network code under development

# Exchange of information and proper communication is crucial

- Categorisation of consumers (protected customer)
- Criteria and process for disconnection
- Aligned system adequacy assessment as base for decisions (e.g. regarding interconnectors and renewables)
- Link to interconnection target 2030 (15%) and related criteria
- Consider regional scarcity
- Assumptions for analyses (worst case ?)
- Trigger levels & communication layers
