1. Executive Summary

The Commission Communication of 19 October 2006 entitled ‘Action Plan for Energy Efficiency – Realising the Potential’ highlighted the possibility of reducing the total energy consumption by 20 % by 2020 by means of a list of targeted actions including the labelling of tyres. The Commission Communication of 7 February 2007 entitled ‘Results of the review of the Community strategy to reduce CO₂ emissions from passenger cars and light-commercial vehicles’ highlighted the potential for reducing CO₂ emissions by means of complementary measures for car components with the highest impact on fuel consumption, such as tyres¹.

Tyres, mainly because of their rolling resistance, account for 20 % to 30 % of the fuel consumption of vehicles. A reduction of the rolling resistance of tyres may therefore contribute significantly to the energy efficiency of road transport and thus to the reduction of emissions. Fuel-efficient tyres are cost-effective since fuel savings more than compensate for the increased purchase price of tyres stemming from higher production costs. Regulation (EC) No 661/2009 of the European Parliament and of the Council of 13 July 2009 concerning type-approval requirements for the general safety of motor vehicles, their trailers and systems, components and separate technical units intended therefor sets out minimum requirements for the rolling resistance of tyres. Technological developments make it possible to significantly decrease energy losses due to tyre rolling resistance beyond those minimum requirements. To reduce the environmental impact of road transport, it is therefore appropriate to lay down provisions to encourage end-users to purchase more fuel-efficient tyres by providing harmonised information on that parameter. Regulation (EC) No 1222/2009 establishes a framework for the provision of harmonised information on tyre parameters through labelling, allowing end-users to make an informed choice when purchasing tyres. The information to be provided under Articles 4, 5 and 6 of Regulation (EC) No 1222/2009 on the fuel efficiency class, the external rolling noise class and measured value, and the wet grip class of tyres shall be obtained by applying the harmonised testing methods referred to in Annex I of Regulation (EC) No 1222/2009. The fuel efficiency class must be determined on the basis of the rolling resistance coefficient (RRC) according to the specified ‘A’ to ‘G’ scale and measured in accordance with UNECE Regulation No 117 and its subsequent amendments.

As described in the proposed Annex IVa to Reg. (EC) 1222/2009 the procedure for inter-laboratory comparison for rolling resistance (RR) should be based upon the generation of assigned RRC values. For the definition of these “assigned values” establishment of reference laboratories will be essential.

A Network of Laboratories was created by the Committee on the Labelling of Tyres under Regulation (EC) No 1222/2009 including an Expert Group, composed of volunteer test laboratories (Technical Services, Tyre Manufacturers) to perform interlaboratory comparison tests on different samples of tyres, in order to establish reference data for rolling resistance measurements. The alignment method for laboratories has to measure tyre rolling resistance and this at the worldwide level.

¹ Official Journal of the European Union, L342/46-58, 22.12.2009: REGULATION (EC) No 1222/2009 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 25 November 2009 on the labelling of tyres with respect to fuel efficiency and other essential parameters

2. Introduction

The European Regulation 1222/2009 is defining labelling classification based upon absolute rolling resistance coefficient (RRC) values. Under Annex I to Regulation 1222/2009 rolling resistance (RR) shall be measured according to Regulation ECE-R117 and its subsequent amendment.

This means that the revised ECE-R117 currently under adoption will apply.

According to experiences of the European tyre industry gained from previous Round-Robin tests for tyre rolling resistance the deviations in test results observed were up to more than 1 N/kN between laboratories.

Due to this observed dispersion between measurement machines, a machine alignment procedure is necessary to get comparative Rolling Resistance Coefficient (RRC) values and give an appropriate competitive playground for the declaration of RRC labelling values according to European Regulation (EC) 1222/2009.

2.1.Participants of the Expert Group

Conveners:

TÜV SÜD (Germany)

UTAC (France)

Tyre manufacturers:

Apollo Vredestein,

Bridgestone,

Continental,

Goodyear,

Michelin,

Pirelli.

Independent Test Laboratories:

UTAC (France),

IDIADA (Spain),

TÜV SÜD Automotive (Germany).

Observers:

JASIC (Japan),

RDW (Netherlands).

2.2.Approach for laboratory alignment

The procedure is based upon the generation of assigned RRC values as described in Annex IVa to Reg. (EC) 1222/2009.

The Expert Group had proposed a 2-steps process for laboratory alignment:

In the first step a Network of Laboratories for the definition of assigned values was created.

This Network of Laboratories is operating the RR test machines and equipment as listed in Annex A.

The preparation of the Laboratory alignment procedure consisted in following actions:

Assess number of alignment tyres for each category C1/C2 and C3

Fix details of alignment tyres (class, dimension, load index, standard or reinforced)

Set up logistics, shipment between laboratories,

Recommend tyre storage conditions.

Establish the test procedure and test conditions for interlaboratory comparison.

Based on the assigned values the Laboratories in the Network are correlated and aligned vs. this “virtual reference laboratory”.

In the second step, once the Network of Reference Laboratories has been established and the alignment vs. the assigned values has been completed, any candidate laboratory can align with any of the Network of Reference Laboratories.

2.3. Procedure for Interlaboratory alignment

The Network of Laboratories was created Sept 3, 2010 by the Committee on the Labelling of Tyres under Regulation 1222/2009.

2.3.1. Choice of laboratories

10 Laboratories were participating to the Interlaboratory alignment process.

The description and the information of the machines to be used for the interlaboratory alignment are given in Annex A

Test Laboratories	ID
TUEV	Lab 0
UTAC	Lab 1
IDIADA	Lab 2
Michelin	Lab 3
JASIC	Lab 4
Goodyear	Lab 5
Continental	Lab 6
Bridgestone	Lab 7
Pirelli	Lab 8
Apollo-Vredestein	Lab 9

2.3.2. Choice of alignment tyres

Five sets of alignment tyres for C1/C2 and five sets of alignment tyres for C3 category were selected by the Expert Group; selection of tyres was accomplished in such way to cover the Load Index and Rolling Resistance, coefficient and force, ranges in conformity with the requirements of Regulation ECE R117.

C1 / C2	LI 70 +/- 5	LI 80 +/- 5	LI 90 +/- 5	LI 100 +/- 5	LI 110 +/- 5

2.3.3. Pre-tests on each batch of tyres

As stipulated by the Expert Group the industry provided the alignment tyres with minimum production variation. But as tyres are never strictly identical, a process of initial measurement of each tyre (3 times) was established in order to assess the tyre category set's individual variance; each of the laboratories providing initial measurements did tests with one whole batch of alignment tyres (same category, brand and design).

Tyre	Pre-tests at Laboratory
A	JASIC
B	Michelin
C	Vredestein
D	JASIC
E	IDIADA
G	IDIADA
H	Continental
J	Goodyear
K	TUEV
L	Bridgestone

2.3.4.Alignment tests for C1-C2 tyres

Each sample of each set of 10 C1-C2 tyres has been tested on one of the 10 machines dedicated to this class of tyres

2.3.5.Alignment tests for C3 tyres

Each sample of each set of 8 C3 tyres has been tested on one of the 8 machines dedicated to this class of tyres

3. Results

The analysis of the results shows that all the Rolling Resistance Machines used comply with the requirement on Sigma m of Regulation (EC) No 1222/2009.

All the results have been collected and recorded on the template report shown in Annex B.

The data formats to be used for the computations and results have been defined by the group:

The measured RRC values corrected from drum diameter and temperature shall be rounded to 2 digits after the comma.

Then the computations will be made with all digits: There will be no further rounding except on the final alignment equations.

All standard deviation values will be displayed with 3 digits after comma.

All RRC values will be displayed with 2 digits after comma.

All alignment coefficients (A11, B11, A2c and B2c) will be rounded and displayed with 4 digits after comma.

These data formats shall be included in Annex IVa of Regulation (EC) No 1222/2009.

Deliverables of the Network of Laboratories Expert Group:

For pre-tests:

Raw data

Qualification of the data

Precision and uncertainty values

Correction factor for each batch

Conclusions

For alignment tests:

Raw data

Qualification of the data

Precision and uncertainty values

Assigned values

Qualification of the assigned value

Alignment curves for the network laboratories

Precision and uncertainty of predicted values

Alignment procedure for candidate laboratories

3.1.Pre-tests results

The repeatability of the pre-test data was analysed, these data include the variation of the RR measurement process as well as the evolution of the tyres during the pre-tests. The goal of the pre-tests was to analyse the variation within

a batch of tyres and to use the results to apply a correction factor if needed. The data and the analysis of these data are given in Annex C to this report.

The analysis of these data has shown that the first test out of three is generally not in line with the two following and for that reason the group has decided to run in the alignment tests four tests instead of three and to use only the three last measurements to calculate the average value. This is a proposal for amendment of the Annex IVa of Regulation (EC) No 1222/2009.

Another outcome from these pre-tests was the maximum variation of the measured RR coefficient for a set of 10 or 8 carefully selected tyres

For C1-C2 = -1.42% / +2.12%

For C3 = -1.92% / +2.51%

Even if we could consider that these results are not so bad for manufactured products, a correction factor was used to normalize the values for future computerization of regression function for each machine. This correction makes no change for assigned values calculation.

3.2.Alignment tests results

Each tyre has been tested on one machine four times and the average of three last measurements has been calculated after applying the correction factor of the tested tyre to each measurement. The data and the analysis of these data are given in Annex D to this report.

From the statistical analysis, when removing one laboratory from the group, the maximum deviation of the assigned values is 1% in the worst case. As a conclusion, the risk of laboratory effect is low and it was agreed to keep all the laboratories in the Network. The impact of corrected/non corrected values on the assigned values was in this case found almost insignificant. The group agreed to use corrected values to exclude variability amongst the tyres in one batch.

4. Conclusion

The experience gained during this Interlaboratory Alignment Procedure for Rolling Resistance Measurement has proved that a pre-test is needed to monitor the dispersion of the batch of tyres and improve the accuracy of alignment equation for each machine. Independent from the variation from one laboratory to another (if they are compliant with the requirement of Annex IVa of Regulation (EC) No 1222/2009) the system is robust.

The experience gained during the pre-test shows that a first test in the same conditions is necessary before starting the series of measurements.

The statistical analysis confirms that the correlation is very high.

Data formats to be used for the computations and results need to be defined in Annex IVa of Regulation 1222/2009.

The accuracy of measured value is improved by this alignment procedure:

Maximum deviation from assigned values before alignment

For C1-C2 = -5.10% / +6.35%

For C3 = -3.65% / ++4.45%

Maximum deviation from assigned values after alignment

For C1-C2 = -2.10% / +2.22%

For C3 = -1.63% / +1.86%

One other document is annexed to this report:

In Annex E: the template for candidate / reference laboratory alignment.

Part A shall be performed before proceeding with Part B

² A_{1l} and B_{1l} are the coefficients defined in annex IVa of Regulation (EC) N° 1222/2009

Annex E - Template for candidate / reference laboratory alignment

A. - General information of Applicant (Candidate laboratory):

Company: _____
 Adress: _____
 City: _____ P.O.Box: _____
 Contact person: _____ Position: _____
 Telephone : _____ Fax: _____ E-mail : _____

a) Tyre manufacturer b) Independent laboratory

Is your company integrated in a Group ? Yes No
 If yes, indicate which one: _____

Candidate machine identification

Trade Mark: _____ Serial number: _____
 Test Lab location: _____ Year of make: _____

Date of last calibration: _____

The laboratory is certified/accredited/compliant to ISO 17025

The facility is certified / compliant to ISO /TS 16949

The laboratory complies with the specifications of ISO 28580 Annex A on test equipment tolerances

Drum Ø [mm]: _____

Drum Surface: _____

Drum material: _____

Where to send the test tyres after testing:

Adress: _____

City: _____ P.O.Box: _____

Contact person: _____

Test tyres provided:

Tyre type:	<input type="checkbox"/> C1	<input type="checkbox"/> C2	<input type="checkbox"/> C3
Method:	<input type="checkbox"/> Force	<input type="checkbox"/> Torque	<input type="checkbox"/> Power <input type="checkbox"/> Deceleration

Test results of the n+1 measurements (corrected for drum diameter and room temperature)

Tyre : Make - Size – Designation	RRC _{1,c} (kg/t)	RRC _{2,c} (kg/t)	RRC _{3,c} (kg/t)	RRC _{4,c} (kg/t)	RRC _{n+1,c} (kg/t)

All the information included by the company in this form will be confidential.

B. - General information of the Reference laboratory

Company: _____
 Adress: _____
 City: _____ P.O.Box: _____
 Contact person: _____ Position: _____
 Telephone : _____ Fax: _____ E-mail : _____

a) Tyre manufacturer b) Independent laboratory

Reference machine identification

Trade Mark: _____ Serial number: _____

Test Lab location: _____ Year of make: _____

Date of last calibration: _____

The laboratory is certified/accredited/compliant to ISO 17025

The facility is certified / compliant to ISO /TS 16949

The laboratory complies with the specifications of ISO 28580 Annex A on test equipment tolerances

Drum Ø [mm]: _____

Drum Surface: _____

Drum material: _____

Test characteristics:

Method: Force Torque Power Deceleration

Test results, average of measurement 2 – 4, corrected for drum diameter and temperature:

Tyre : Make - Size – Designation	RRC _{2,l} (kg/t)	RRC _{3,l} (kg/t)	RRC _{4,l} (kg/t)	RRC average reference lab (kg/t)

Candidate machine measurement reproducibility: σ_m (kg/t): _____

Regression formula³: **RRC = aligned value (kg/t)**
RRC_{m,c} = candidate's measurement (kg/t)

$$RRC = a * RRC_{m,c} + b$$

$$a = \underline{\hspace{2cm}}$$

$$b = \underline{\hspace{2cm}}$$

$$a = A1_l * A2_c$$

$$b = A1_l * B2_c + B1_l$$

Date: _____

Stamp and Signature: _____

³A_{1l}, B_{1l}, A_{2c} and B_{2c} are the coefficients defined in annex IVa of Regulation (EC) N° 1222/2009

RRC_{m,l} is the measured value of the rolling resistance coefficient by the reference laboratory (l) (including temperature and drum diameter corrections)

RRC_{m,c} is the measured value of the rolling resistance coefficient by the candidate laboratory (c) (including temperature and drum diameter corrections)
